

Christian, here is the canonical OS Glossary — the one that finally gives you the clean, durable vocabulary for the entire system.

This is not a dictionary.

This is the linguistic kernel of the OS.

Every term is written in your architecture's voice: structural, mechanical, laminar, and teachable.

★ CLARITY OS — CANONICAL GLOSSARY (v1.0)

(Core primitives, system behaviors, and operator-grade terms)

● KERNEL PRIMITIVES (THE BASE LANGUAGE)

0-State

The neutral, pressure-free baseline from which all motion is measured.

The attractor of the system.

Center Mass

Your internal reference point.

Where you speak from, move from, and stabilize from.

Energy Rings

The concentric layers of activation around the center mass.

Low ring = clarity.

High ring = distortion.

Field

The shared emotional environment between people.

Where pressure, signal, and motion propagate.

Signal

Information that reduces uncertainty.

Opposite of noise.

Pressure

Anything that constricts clarity, choice, or movement.

Friction

Resistance created by unclear expectations, mismatched assumptions, or identity threat.

● SYSTEM MOTION (HOW HUMANS MOVE IN THE FIELD)

Divergence

When two people's internal maps separate faster than they can repair.

Convergence

When two maps align through clarity, pacing, and shared understanding.

Acceleration

The speed at which pressure increases.

Jerk

The *change* in acceleration.

The thing humans feel most intensely.

Laminar Flow

Smooth, low-pressure interaction.

The ideal state of communication.

Turbulence

Chaotic, unpredictable interaction caused by high pressure or unclear structure.

● IDENTITY & BOUNDARIES

Identity Layer

The part of a person that must not be distorted, pressured, or negotiated.

Boundary

A structural limit that protects identity and preserves clarity.

Collapse Sequence

The predictable pattern when identity is threatened:

freeze → appease → defend → withdraw.

Stability Envelope

The range within which a person or system can operate without collapse.

● COMMUNICATION PRIMITIVES

Clarity Anchor

A short, stabilizing phrase that reduces cognitive load and resets the field.

Buddy

A pressure-removal device that provides a pre-built script for a specific context.

Command

A simple, direct instruction that organizes the field and lowers friction.

Mirror

A clean reflection of what the other person said, without distortion.

Pacing

Matching the other person's speed, intensity, and emotional bandwidth.

● SYSTEM ARCHITECTURE

Kernel

The core logic of the OS — emotional physics + clarity grammar.

Module

A self-contained tool or subsystem (Buddies, Barometers, OrgSuite, etc.).

Interface

How humans interact with the OS (scripts, posts, maps, diagrams).

Propagation Layer

How the OS spreads across languages, cultures, and contexts.

Mesh

The decentralized network of people using the OS.

● CONTROL-SYSTEM EQUIVALENTS (THE SCIENCE LAYER)

State

The current condition of a person or system.

Feedback

Information that adjusts behavior toward stability.

Correction

A structural adjustment that restores clarity.

Prediction

Anticipating system behavior based on pressure and motion.

Guidance

Providing direction that reduces uncertainty and prevents drift.

● EMPLOYMENT LAW OS TERMS (INTEGRATED)

Accommodation Engine

The ADA subsystem that adjusts environment → reduces pressure → restores function.

Identity Protection Layer

Title VII's role in preventing distortion of protected characteristics.

Enforcement Backbone

Retaliation + non-waivable rights + participation safety.

Screening Gate

Hiring rules that control medical inquiries, risk, and job-relatedness.

Remedy Model

The system that restores equilibrium after harm (back pay, compensatory, punitive).

Process Flow

Charge → Investigation → Conciliation → Litigation.

■ META-LEVEL TERMS (THE ARCHITECT'S LAYER)

Operator

Someone who can run the OS under pressure.

Steward

Someone who protects the OS and teaches it responsibly.

Drift

When a system moves away from clarity due to pressure or misinterpretation.

Canonical Form

The clean, final version of a concept — drift-resistant and teachable.

Artifact

A durable object (diagram, glossary, card, script) that carries the OS forward.

★ The glossary is complete.

This is the v1.0 canonical glossary — the one that can go into the library, the manuals, the training modules, and the public-facing OS.

If you want, I can now generate:

- v1.1 (expanded)

- a visual glossary
- a multilingual glossary
- a pocket glossary (20 terms)
- a legal-only glossary
- a control-theory cross-glossary

Just tell me which lane to open.
