

Predator Geometries in Global History

You're basically asking:

"If I look at the whole planet as one field, which predator-geometries dominate when?"

Let's run the global arc in compressed form.

1. River age - fish geometry (hydraulic cores)

Time band: earliest states → ~500 BCE

Dominant medium: rivers, basins, enclosed hydrology

Centers:

- Nile (Egypt)
- Tigris-Euphrates (Mesopotamia)
- Indus
- Yellow River (early China)

Geometry:

Enclosure, irrigation, basin control, slow dynastic cycles.

The world is mostly **fish-civilizations** with small forest and steppe fringes.

2. Axial + classical - fish + tigers + early eagles

Time band: ~500 BCE → 500 CE

Hydraulic (fish):

- Han China
- Late pharaonic / Nile systems
- Ganges basin polities

Forest (tiger):

- Germanic tribes
- Southeast Asian mandala states
- Japanese archipelago (early)

Early gas (eagle):

- Phoenicians
- Greek maritime networks
- Carthage

Ionized Rome sits as a hybrid:

- hydraulic + steppe-frontier + maritime, but structurally **ionized** (diffuse, fragmentation-prone).

Global picture:

Basins still anchor, but **forest and maritime edges** start to matter.

3. Steppe age - lions overrun the interior

Time band: ~500 → 1400 CE

Steppe (lion) dominance:

- Huns
- Göktürks
- Arabs (early caliphate has strong steppe vector)
- Seljuks
- Mongols

They:

- collapse basin states
- bridge East-West
- create continental empires

Hydraulic cores (China, Persia, India) survive by **absorbing** lions.

Forest polities (Europe) harden under pressure.

Global picture:

The **lion geometry** (steppe) is the main shock-agent across Eurasia.

4. Viking + littoral rupture - crocodiles on the seams

Time band: ~800 → 1100 CE (overlapping steppe age)

Littoral (crocodile) actors:

- Vikings in North Atlantic and European rivers
- Sea Peoples earlier as a similar pattern
- Early Normans as a transitional form

They:

- raid coasts and rivers
- bypass fortifications
- force new political forms (castles, coastal defenses, centralized kingship)

Global picture:

While lions dominate the **interior**, crocodiles rupture the **edges** of Europe.

5. Oceanic age - eagles and sharks

Time band: ~1400 → 1900 CE

Gas-phase (eagle) empires:

- Portuguese, Spanish, Dutch, British
- later US as maritime-financial hybrid

They:

- ride winds and currents
- build global trade arcs
- project power via fleets

Shark-phase (pirates):

- Caribbean pirates
- Barbary corsairs
- Wokou
- Indian Ocean raiders

They parasitize the same medium.

Hydraulic and steppe systems get subordinated to **maritime geometry**.

Global picture:

The **ocean becomes the main medium**; eagles and sharks set the rules.

6. Industrial-imperial mesh - stacked geometries

Time band: ~1850 → 1945

You get **layered predator forms**:

- **Eagles:** British, later US global naval/air projection
- **Lions:** residual steppe/land empires (Russia, Ottomans, Qing frontier)
- **Tigers:** guerrilla and forest wars (Balkans, Southeast Asia)
- **Scavengers:** warlord zones, colonial collapse pockets

Global picture:

No single geometry dominates; instead, **stacked mediums** and overlapping predator types.

7. Collapse + scavenger age - entropy predators

Time band: ~1945 → present (and intensifying)

Entropy-phase (scavenger) actors:

- warlords in failed states
- insurgencies in collapse zones

- cartels and shadow networks
- digital-attention scavengers (identity field)

They feed on:

- post-imperial vacuums
- institutional decay
- fractured identities

At the same time:

- **eagle geometry** persists (US + global air/sea projection)
- **tiger geometry** in insurgent/forest/mountain warfare
- **shark geometry** in financial and data flows (abstracted ocean)

Global picture:

We're in a **mixed-phase world** where entropy-predators are rising inside and between older geometries.

8. Compressed summary

If you compress the whole planet into one line:

1. **Rivers (fish)** - basins rule
2. **Rivers + forests + early sea (fish + tigers + eagles)**
3. **Steppe (lions)** - interior shock
4. **Littoral rupture (crocodiles)** - coastal shock
5. **Oceans (eagles + sharks)** - global maritime order
6. **Stacked mediums** - land + sea + air + forest
7. **Entropy (scavengers)** - collapse-field actors inside all of the above

If you want, next step could be:

- pick **one region** (e.g., Europe, China, Indian Ocean) and run its predator-geometry timeline
- or map **where we are now** in terms of predator types in the digital/information field.
